

elisp literate library

a literate programming tool to write emacs lisp codes in org mode.

1 Introduction

An emacs library or configuration file can write in org mode then tangle to an elisp file later, here is one example: [Emacs configurations written in Org mode](#) .

But What if I want to write a library or a configuration file in org file and load it to emacs directly? If it can, then we will have an uniform development environment without keeping multiple copies of codes. Furthermore, we can jump to the elisp definition in an org file directly when required. That will be a convenient way for our daily development.

2 How to do it?

In org mode, the comment line start with character # (see [org manual](#)), and the emacs lisp codes surround by lines between `#+begin_src elisp` and `#+end_src` (see [org manual](#)).

```
#+BEGIN_SRC elisp :tangle no
(message "this is a test.~%")
#+END_SRC
```

So to let emacs lisp can read an org file directly, all lines out of surrounding by `#+begin_src elisp` and `#+end_src` should mean nothing, and even codes surrounding by them should mean nothing if the options in a code block request such behavior.

Here is a trick, a new emacs lisp reader function get implemented (by binding elisp variable `load-read-function`) to replace original read function when using elisp function `load` to load a org file.

The new reader will make elisp reader enter into org mode syntax, which means it will ignore all lines until it meet `#+BEGIN_SRC elisp`.

When `#+begin_src elisp` occur, org options for this code block will give us a chance to switch back to normal emacs lisp reader or not.

And if it switch back to normal emacs lisp reader, the end line `#+END_SRC` should mean the end of current code block, so it occur, then the reader will switch back to org mode syntax. if not, then the reader will continue to read subsequent stream as like the original emacs lisp reader.

3 Implementation

3.1 Preparation

There is a debug variable to switch on/off the log messages for this library.

```
(defvar literate-elisp-debug-p nil)
```

a dynamic Boolean variable bound by our read function while parsing is in progress. It'll indicate whether org mode syntax or elisp mode syntax is in use (which is in an org code block).

```
(defvar literate-elisp-org-code-blocks-p nil)
```

3.2 stream read functions

To give us the ability of syntax analysis, stream read actions such as peek a character or read and drop next character should get implemented.

The `input streams` are the same streams used by the original elisp `read` function.

3.2.1 literate-peek

```
(defun literate-peek (in)
  "Return the next character without dropping it from the stream.
Argument IN: input stream."
  (cond ((bufferp in)
        (with-current-buffer in
          (when (not (eobp))
            (char-after))))
        ((markerp in)
         (with-current-buffer (marker-buffer in)
           (when (< (marker-position in) (point-max))
             (char-after in))))
        ((functionp in)
         (let ((c (funcall in)))
           (when c
             (funcall in c))
           c))))
```

3.2.2 literate-next

```
(defun literate-next (in)
  "Given a stream function, return and discard the next character.
Argument IN: input stream."
  (cond ((bufferp in)
        (with-current-buffer in
          (when (not (eobp))
            (progl
             (char-after)
             (forward-char 1))))))
        ((markerp in)
         (with-current-buffer (marker-buffer in)
           (when (< (marker-position in) (point-max))
             (progl
              (char-after in)
              (forward-char 1))))))
        ((functionp in)
         (funcall in))))
```

3.2.3 literate-read-until-end-of-line

when read org file character by character, if current line determines as an org syntax, then the whole line should ignore, so there should exist such a function.

Before then, let's implement an abstract method to read characters repeatedly while a predication meet.

```
(defun literate-read-while (in pred)
  "Read and return a string from the input stream, as long as the predicate.
Argument IN: input stream.
Argument PRED: predicate function."
  (let ((chars (list)) ch)
    (while (and (setq ch (literate-peek in))
                (funcall pred ch))
      (push (literate-next in) chars))
    (apply #'string (nreverse chars))))
```

Now reading until end of line is easy to implement, the ignored string return from this function because it may be useful sometimes, for example when reading options after `#+begin_src elisp`.

```
(defun literate-read-until-end-of-line (in)
  "Skip over a comment (move to 'end-of-line').
Argument IN: input stream."
  (progn
    (literate-read-while in (lambda (ch)
                              (not (eq ch ?\n))))
    (literate-next in)))
```

3.3 handle org mode syntax

3.3.1 source code block option tangle

There are a lot of different elisp codes occur in one org file, some for function implementation, some for demo, and some for test, so an org code block option `tangle` to decide to read them or not should define, and it has three meanings:

- yes
It means that current code block should load normally, it is the default mode when the option `tangle` is not provided.
- no
It means that current code block should ignore by elisp reader.

```
(defun literate-tangle-p (flag)
  "Tangle current elisp code block or not
Argument FLAG: flag symbol."
  (case flag
    (no nil)
    (t t)))
```

Let's implement a function to read options after `#+BEGIN_SRC elisp`, and convert every key and value to a elisp symbol.

```
(defun literate-read-org-options (options)
  "Read org code block options.
Argument OPTIONS: a string to hold the options."
  (loop for token in (split-string options)
        collect (intern token)))
```

3.3.2 basic read routine for org mode syntax.

Let's define the main read routine to read an org file input stream. the basic idea is simple, ignore all lines out of elisp source block, and be careful about the special character #.

```
(defun literate-read-datum (in)
  "Read and return a Lisp datum from the input stream.
Argument IN: input stream."
  (let ((ch (literate-peek in)))
    (cond
     ((not ch)
      (error "End of file during parsing"))
     ((and (not literate-elisp-org-code-blocks-p)
           (not (eq ch ?\#)))
      (let ((line (literate-read-until-end-of-line in)))
        (when literate-elisp-debug-p
          (message "ignore line %s" line)))
      nil)
     ((eq ch ?\#)
      (literate-read-after-sharpsign in))
     (t (read in)))))
```

3.3.3 how to handle when meet

1. The basic logic

- a) if it is inside an org syntax, check if it is `#+begin_src` elisp
 - i. if it is not, continue to use org syntax and ignore this line
 - ii. if it is, read source block options for this code block
 - A. if it should tangle, switch to elisp syntax context
 - B. if it should not tangle, continue to use org syntax and ignore this line
- b) if it is inside an elisp syntax, then check if it is `#+`
 - i. if it is, then switch to org mode syntax. because this is the only legal meaning when it is equal to `#+end_src`, so the test here is a little simple.
 - ii. if it is not, then use original elisp reader to read the following stream

it should be some legal elisp expressions such like #'(lambda
()).

2. The implementation

```
(defvar literate-elisp-begin-src-id "#+BEGIN_SRC elisp")
(defun literate-read-after-sharpsign (in)
  "Read after #.
Argument IN: input stream."
  (literate-next in)
  ;; 1. if it is not inside an elisp syntax
  (cond ((not literate-elisp-org-code-blocks-p)
    ;; 1.1 check if it is `#+begin_src elisp'
    (if (loop for i from 1 below (length literate-elisp-begin-src-id)
      for c1 = (aref literate-elisp-begin-src-id i)
      for c2 = (literate-next in)
      thereis (not (char-equal c1 c2)))
      ;; 1.2. if it is not, continue to use org syntax and ignore this line
      (progn (literate-read-until-end-of-line in)
        nil)
      ;; 1.3 if it is, read source block options for this code block
      (let ((org-options (literate-read-org-options (
        ↪ literate-read-until-end-of-line in))))
        (when literate-elisp-debug-p
          (message "found org elisp src block, options:%s" org-options))
        (cond ((literate-tangle-p (getf org-options :tangle))
          ;; 1.4 if it should be tangled, switch to elisp syntax context
          (when literate-elisp-debug-p
            (message "enter into a elisp code block"))
            (setf literate-elisp-org-code-blocks-p t)
            nil))))))
      ;; 1.5 if it should not be tangled, continue to use org syntax and
      ↪ ignore this line
      (t
        ;; 2. if it is inside an elisp syntax
        (let ((c (literate-next in)))
          (when literate-elisp-debug-p
            (message "found %#c inside a org block" c))
          (case c
            ;; 2.1 check if it is ~#+~, which has only legal meaning when it is
            ↪ equal `#+end_src'
            (?\+
              (let ((line (literate-read-until-end-of-line in)))
                (when literate-elisp-debug-p
                  (message "found org elisp end block:%s" line)))
              ;; 2.2. if it is, then switch to org mode syntax.
              (setf literate-elisp-org-code-blocks-p nil))
            ;; 2.3 if it is not, then use original elisp reader to read the
            ↪ following stream
            (t (read in)))))))
```

3.4 load org file with new syntax

3.4.1 literate reader is in use when loading a org file

```
(defun literate-read (&optional in)
  "Literate read function.
Argument IN: input stream."
```

```

(if (and load-file-name
      (string-match "\\..org\\'" load-file-name))
    (iterate-read-datum in)
    (read in)))

(defun iterate-load (path)
  "Literate load function.
Argument PATH: target file to load."
  (let ((load-read-function (symbol-function 'iterate-read))
        (iterate-elisp-org-code-blocks-p nil))
    (load path)))

```

3.4.2 an interactive command to load a literate org file directly from emacs

```

(defun iterate-load-file (file)
  "Load the Lisp file named FILE.
Argument FILE: target file path."
  ;; This is a case where .elc and .so/.dll make a lot of sense.
  (interactive (list (read-file-name "Load org file: " nil nil 'lambda)))
  (iterate-load (expand-file-name file)))

```

3.4.3 a function to byte compile a literate org file

(todo)

```

(defun iterate-byte-compile-file (file)
  "Byte compile an org file.
Argument FILE: file to compile."
  )

```

3.5 function to tangle org file to elisp file

So one can build an emacs lisp file from an org file without depending on literate-elisp library.

```

(cl-defun literate-tangle (file &key (el-file (concat (file-name-sans-extension file) "
↳ .el"))) header tail)
  "Literate tangle
Argument FILE: target file"
  (let* ((source-buffer (find-file-noselect file))
         (target-buffer (find-file-noselect el-file))
         (load-read-function (symbol-function 'iterate-read))
         (iterate-elisp-org-code-blocks-p nil))
    (with-current-buffer target-buffer
      (delete-region (point-min) (point-max))
      (when header
        (insert header "\n"))
      (insert ";; This file is automatically generated by 'literate-tangle' from file `
↳ "
              (pathname-name file) "." (pathname-type file) "'\n\n"
              ";;; Code:\n\n"))
    (insert
      (with-output-to-string
        (with-current-buffer source-buffer

```

```

(goto-char (point-min))
(loop for obj = (progn
  ;; ignore whitespace or newline because reader can't
  ↪ handle them.
  (while (find (char-after) ' (? \n ? \ ? \t))
    (forward-char 1))
  (literate-read-datum source-buffer))
  if obj
  do (pp obj)
  (princ "\n")
  until (eobp))))
(when tail
  (insert "\n" tail))
(save-buffer)
(kill-current-buffer)))

```

And when a new version of `./literate-elisp.el` can release from this file, the following code should execute.

```

(literate-tangle
 "literate-elisp.org"
 :header ";;; literate-elisp.el --- literate program to write elisp codes in org mode
  ↪ -- lexical-binding: t; --"
